                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., pixed quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the chone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

EMBL; SW:, SMISSEROT; TT:, TREMBL; WD:, WORMPEP; information of the WORWPEP database can be found at

                                                                                                                                                                                                          NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1105

Center project Information
Center clone name: GFPQ

Center clone name: GFPQ

Center clone name: GFPQ

Center clone name: GFPQ

Consensus quality: 215957 bases at least Q40

Consensus quality: 225988 bases at least Q30

Consensus quality: 225088 bases at least Q30
by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           865

Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinkton, Cambridgeshire. CB10 15A, UK. E-mail enquiries: vega@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk

On Oct 24, 2001 this sequence version replaced gi:15028618.
The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10 mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr10
RPDI-414X1 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

Computational Analysis Full-Length Mouse cDNAs Compared with Human Genome Sequences Mam. Genome. 12, 673-677 (2001)

Normalization and subfurction of cap-trapper-selected CDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (1), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pippeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods or the mouse full-length cDNA encyclopedia: real-time equence Clustering for construction of a nonredundant cDNA librar. Genome Res. 11 (2), 281-289 (2001)

CDNA library was prepar and sequenced in Mouse Genome Exploration Research Group in Riken Genomic Sciences Center and Sequenced in Mouse Genome Exploration Research Group in Riken Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

Tissues were provided b Dr. John Todd (Dept. of Medical Genetics Wellcome Trust/MRC building Adden rookes Hospital Cambridge) whose assistance we gratefully acknowledge.

Please visit our web sie (http://genome.gsc.riken.go.jp) for further details.

At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least port of one strand has an overhang of 1-4 nucleotices. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals of plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ression inhibitor; oncogene; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        슝
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human cell division regulating protein 27, the polynucleotide encoding it, preparing the polypeptide by DNA recombinant techniques, application of the polypeptide in treating diseases, such as cancer, human immunodeficiency virus (HIV) infection, immunopathy and the antagonist of the polypeptide and its medical action and application of the polynucleotide. The present sequence is that of the human cell division regulating protein 27 encoding DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    540

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonoclectides (dernal and II), both with a double-stranded (ds) structure of at most 49 sequential nuclectide pairs. At least part of one strind (S1, S2) of the ds structures in each of dsrNM1 and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded CC RNA inhibition (RNM1). The method is particularly used to treat tumours or infections, especially by Plemodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known method using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the cend, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 748

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene at least one oligoribonucleotide (dsRNAI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of
                                                                                             988
                                                                                                                           768
                                                                                                                                                                                         828

The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonuclectide that has a double-stranded structure consisting of at most 49 sequential nuclectide pairs, with at least part of one strand cranded segment of 1-4 nt. The method provides oligoribonuclectides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonuclectides may also be directed against genes present in pathogens (e.g. plasmodium or viruses/viroids) pathogenic on humans, animals or plants) or against cytokine, Id, developmental or prion genes the method provides more effective inhibition of gene expression than use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GATAAATCTGACTTCGTCTTCAGGTGTAACCTCCCCCAATCACAGGGAGGCGCTAGTAAA 748
